

Notes:

In cases of duplicates, we used (for each analyte) the higher of the two values. These samples have 'Dmax' appended to the sample ID, and are missing date and time information because both of the original two samples may be represented in the final sample for different analytes (e.g. the Iron value for one sample and the Manganese and Chromium for the other).

The columns labeled "median" are the original median XRF values, while the columns labeled "Adj" are the adjusted versions of the median values.
